Load ratings do not exceed 85% of tipping with crane standing level on firm, uniformly supporting surface. Outrigger ratings at radii of 28 feet or less are based on strength, not stability. Safe loads depend on ground conditions, boom length, radius of operation, condition and inflation (100 psi) of tires, and proper handling, all of which must be taken into consideration by user.

"Radius in feet" is the horizontal distance at ground level from center pin to a vertical line through the center of gravity of the suspended load. Blocks, slings, buckets and other load-carrying devices are considered part of the load. Ratings marked (*) require retractable "A" frame fully raised. Crane will self-erect 150 ft. boom plus 50 ft. No. 7HL Jib or 40 ft. of No. 6 Jib, with tackle not suspended. For Jib Ratings See Sheet-454.02 or 14.02 - Sheet 454.35 or 14.35.

In duty cycle work (dragline, clamshell, grapple, magnet, etc.) the combined weight of bucket and load must not exceed either 8,700 lbs. or 50% of the rating (outriggers set) at the boom tip radius. This rating should be reduced by an additional 10% when working under unfavorable conditions, in sticky material, or when the machine does not stand on firm level ground.
