Notes

1. All rated loads are based on the machine being operated on the firm, level, uniformly supporting surface ground, at any point of 360-around the machine within 78% of tipping load and forward stability factor over 1.15.

Working radius is horizontal distance from center of rotation to a vertical line through the center of gravity of the load.
2. To determine actual lifting loads, the weight of all lifting devices such as hook must be reduced from the lifting loads.

70 ton hook990 kg

45 ton hook550 kg

35 ton hook500 kg

15 ton hook450 kg

6.5 ton hook250 kg
3. The following weight must be reduced from the lifting loads to determine rated lifting loads for main boom when the jib is equipped.

Aux. jib400 kg

9.0 m jib1,200 kg

12.0 m jib1,500 kg

15.0 m jib1,800 kg

18.0 m jib2,100 kg
4. Depending on the number of part lines, rated lifting loads are limited as follows.

1 part lineup to 6.5 ton

2 part linesup to 13.0 ton

3 part linesup to 19.5 ton

4 part linesup to 26.0 ton

5 part linesup to 32.5 ton

6 part linesup to 39.0 ton

7 part linesup to 45.5 ton

8 part linesup to 52.0 ton

9 part linesup to 58.5 ton

10 part linesup to 70.0 ton
5. The aux. jib can be equipped in the range of boom length from 12 m to 51 m boom. To determine the rated lifting loads, 0.4 ton must be reduced from the lifting loads for each boom length in the lifting load chart. However the max. lifting load should not exceed aux.jib capacity of the load.
6. When the 9 m~18 m jib mounted, the lifting loads to be determined by "Jib Rated Lifting Loads".
7. The total weight of the main hook and the jib hook must be reduced from the rated load when lifting on the jib hook with the main hook being attached.
8. The angle formed by the extension line of main boom and the centerline of jib (offset angle) should not exceed 30 degree while the loads being lifted.
