#### Notes:

1. Capacities shown are in metric tons (lbs) and are based on 75% of minimum tipping loads — over the side — with machine standing level on firm supporting surface under ideal job conditions. Deductions from the lifting crane capacities must be made for weight of hook block. Capacities shaded are limited by strength of boom, or factors other than stability.

2. Boom live mast required when operate with 61.00m (200') or longer boom length and gantry must be raised position for all operating conditions.
3. Mid point suspension should be used when operate with 70'15" m (230') or longer boom length.

**Notes:**

1. The jib capacities are equal to the crane lifting capacities of the main boom on which the jib is fixed except that they are restricted by the maximum jib capacities shown above.
2. Jib working radius does not exceed the working radius of the main boom which fits the jib.
3. Deductions from the jib capacities must be made for weight of hook block.

5. The jib set angle to boom must not exceed 30°.

4. When operating of the main boom peak sheave with jib on boom, following deductions in machine lifting capacities must be made.
